Hi Cathy, a Thoi,

I have compiled several critical questions regarding integration, data sources, and platform architecture. Clarification on these points is essential before development begins, as they directly impact the technical scope and timeline.

This email comprises the core clarifying questions and a proposed development timeline.

1. Critical Technical Ambiguities
- Our current system is based on WordPress CMS, Quickbooks, and an unknown third-party system. The core ambiguity lies in determining the single source of truth for the new B2B portal:
- Input & Data Source:** The specific system providing the **real-time stock levels** and **wholesale pricing** for the Partner Hub is undefined.
 - Output & Fulfillment:** The systems responsible for generating and storing downloadable **invoices** and the technical method for **dropshipping fulfillment integration** are not specified.
 - Central Management Platform:** The requirements for a "secure login & encrypted data," "scalable architecture," and "API-ready" portal strongly suggest a dedicated application is needed (e.g., Supabase, Firebase) rather than solely extending the existing WordPress CMS. Is this to be a mobile-app or web based portal? Though if if its to be a mobile-friendly, its best to have web version and an app version to support.
2. Specific Questions Requiring Board Feedback

To define the scope and architecture, I require decisions on the following:

- Minimum Order Quantity (MOQ):** What is the final definition of MOQ? Is this a fixed numerical value per product, or does it vary based on the partner's pricing tier?
- Shipping Costs:** Can I have the rule framework for calculating shipping costs per product weight per region? Also, will the shipping rates applied in the Partner Hub be the same as the rates currently used on the public-facing Qtoys website?
- Order Management and Stock Sources:** Which platform will serve as the single source of truth for **live inventory/stock levels** and **orders management**? Is this Quickbooks, the WordPress CMS, or another platform?
- Media Library Scope:** The Marketing Resource Library is for partners to download product images and marketing assets. Does the scope of the central media library include only product-related assets, or must it also store images and media for other areas like blogs and news, which would require a broader integration?
- Central Management Platform:** To meet the "API-ready for automation," "secure login," and "scalable architecture" requirements for the Partner Hub, should the core application logic (user management, pricing tiers, order handling) be developed on a dedicated, API-first backend (e.g., Supabase, Firebase, etc.) rather than solely extending the existing WordPress CMS?

3. Clarification on Dropshipping Automation

Dropshipping automation (Phase 2) focuses on automating data transfer between the partner's order submission and Qtoys fulfillment. This includes:

- Order Forwarding:** Automatically transmitting the order and customer shipping details directly to the Qtoys fulfillment system.
- Tracking Update:** Automatically receiving the tracking number from fulfillment and pushing it back to the Partner Hub dashboard.
- Packing Slip:** Automatically generating or instructing Qtoys fulfillment to use a packing slip branded with the partner's name/logo.

4. Proposed Development Timeline

Given my current responsibilities (web administration, security, chatbot integration), I propose the following timeline, which includes a critical Pre-Phase 1 stage to establish the necessary modern infrastructure.

Phase	Duration	Key Objective
Pre-Phase 1: Infrastructure & Core Integration	2-3 Weeks	Finalize the new platform (e.g., Supabase/Firebase) and deploy the environment. Establish the secure, real-time, read-only API connection to the inventory system (Quickbooks/other) to retrieve stock, price, and MOQ data.
Phase 1: Core MVP	6 Weeks	Implement Secure Login & Access Control (roles, password management), the Trade Product Catalogue (displaying live stock/price), the core Ordering Dashboard (reorder, search, save carts), and basic Order Management (users track status; admin views/manages orders).
Phase 2: Dropshipping & Marketing	1-2 Months	Implement the Dropshipping Module (including automation integration) and the Marketing Resource Library (file management and partner downloads).
Phase 3: Future Enhancements	TBD	

I request a meeting to discuss these points and obtain approval for the platform choice and proposed timeline.

Kind regards,

Anh Tran
